

## **Reducing risk of Coronary Artery Disease in families**

### **Study volunteers needed**

**Baker Heart and Diabetes Institute** is conducting a study on prevention of Coronary Artery Disease in people who have a family history of this illness

Are you:

- between 40–70 years of age
- have an immediate family member (parent, brother or sister) who has had a heart attack, stent or surgery under the age of 60, or non-immediate family member (grandparent, uncle or aunt) under the age of 50.
- not currently taking a statin drug.

You may qualify for an important study of coronary scanning to reduce the risk of heart attack or other evidence of arterial disease.

If you are interested and would like further information please contact Jo Harris:
