

An Eco-Minute—Is it the truth?

When heavy snow, cold, and high winds strike, people often think, ‘How can this be global warming!’

“Disinformation” is a serious problem in the world today. Many will use cold weather to argue that global warming isn’t happening. Short term weather variations are ongoing but medium to long-term trends don’t lie. The year 2024 was the hottest on record, and oceans are warming rapidly. Ice is developing late on the Great Lakes this year due to global warming, which is why we’re seeing more moisture and snow.

Ninety-eight percent of credible global experts and scientists internationally agree climate change is happening, and is the direct result of emissions from the burning of fossil fuels and the other pollutants we are putting into the atmosphere. And they are very concerned about the future!

**For more information, see the video or review the article, and be prepared to debunk climate myths when you hear them.**
